	7. Conclusion
	All and the second
Prise en	compte des
nœuds d	constructifs dans la PEB
0	
U	

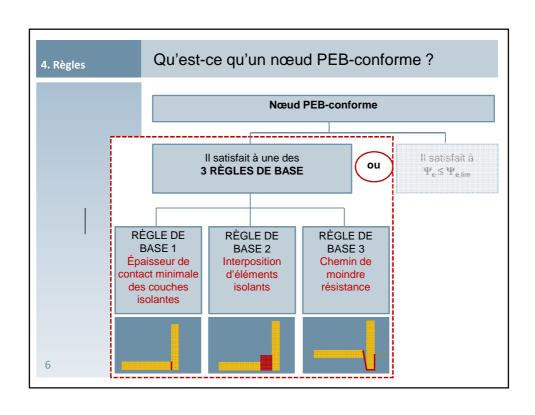

4. Règles	
	Méthode des noeuds PEB conformes
1	

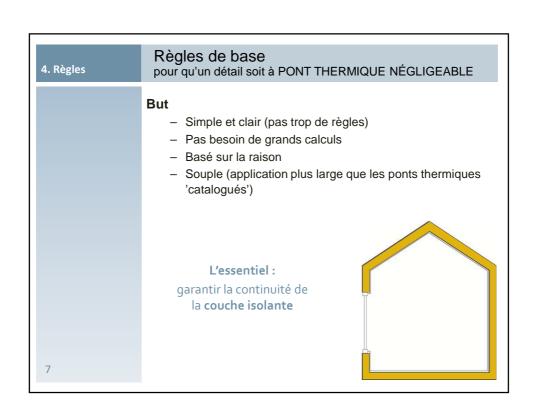

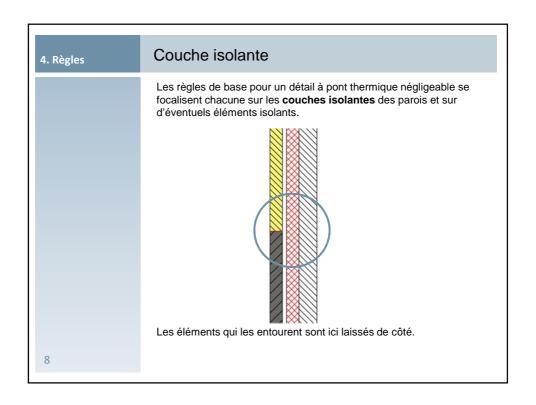

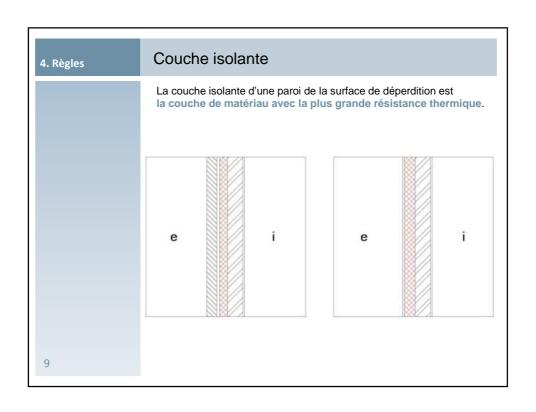

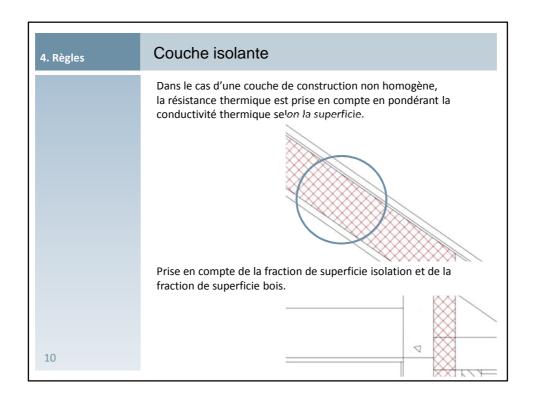

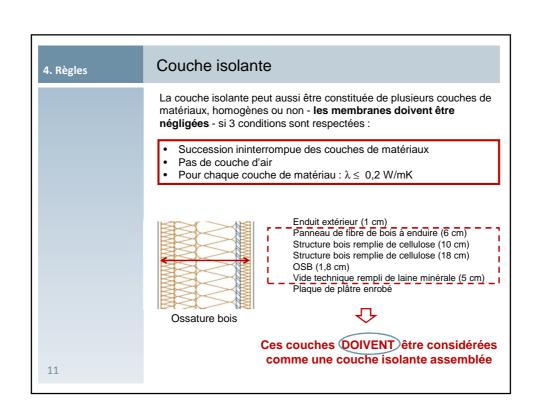

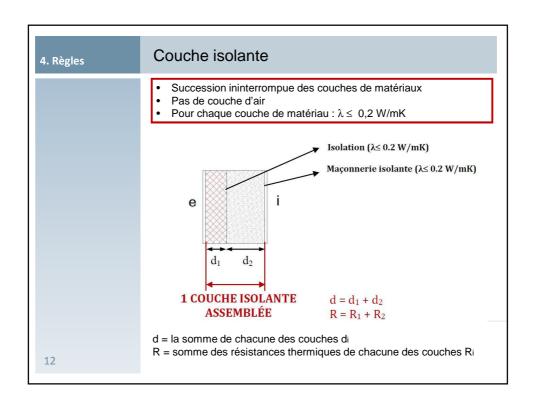

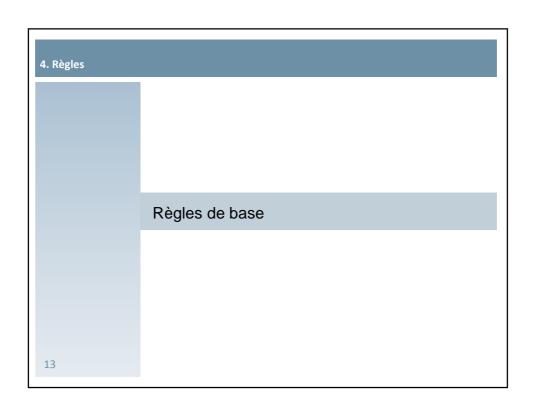

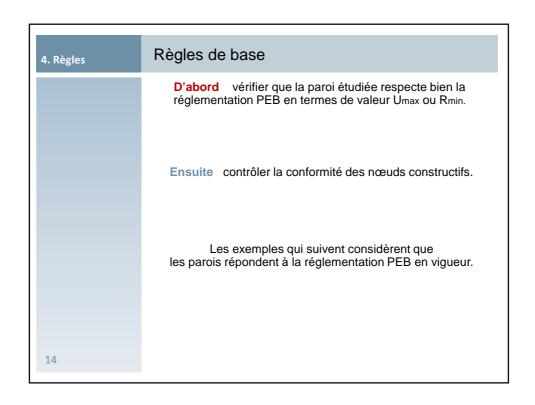

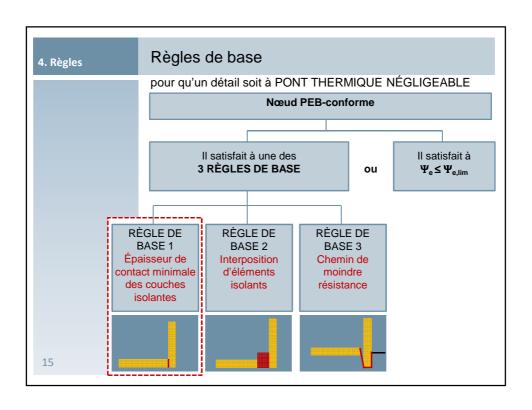

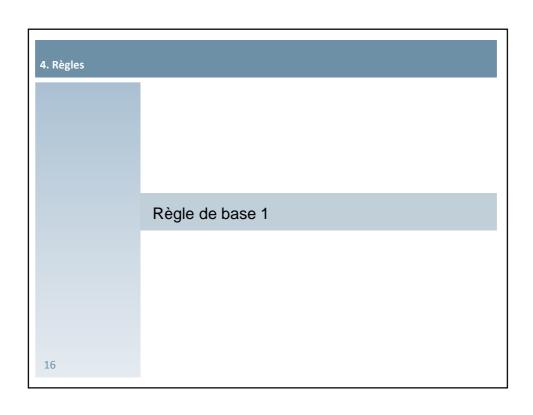

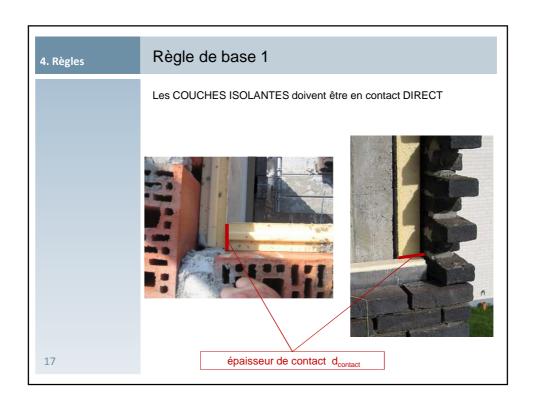

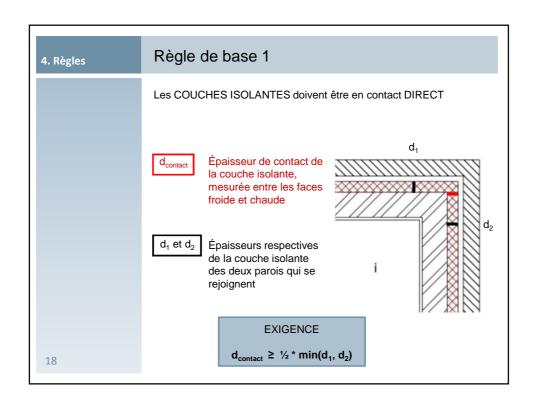

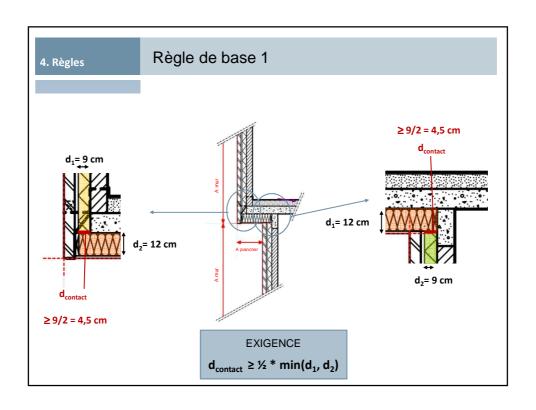

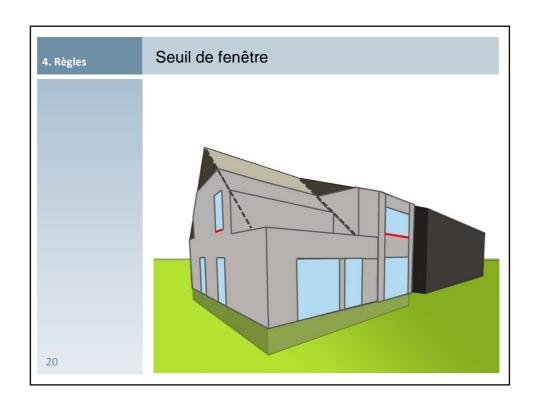

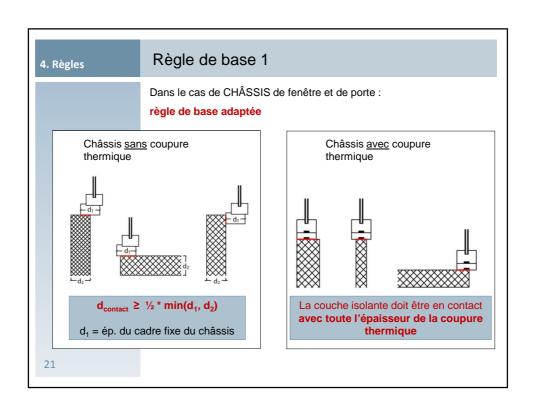

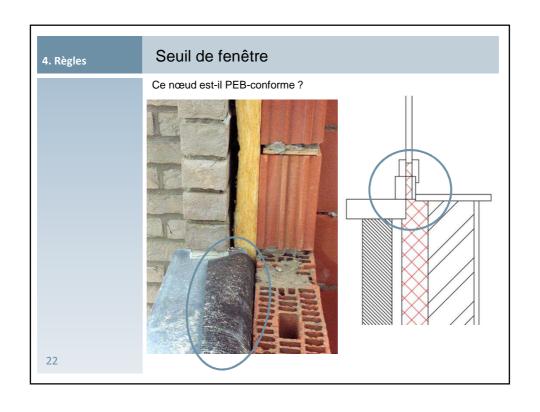

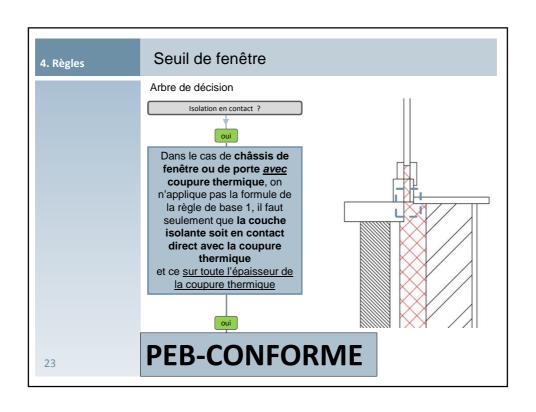

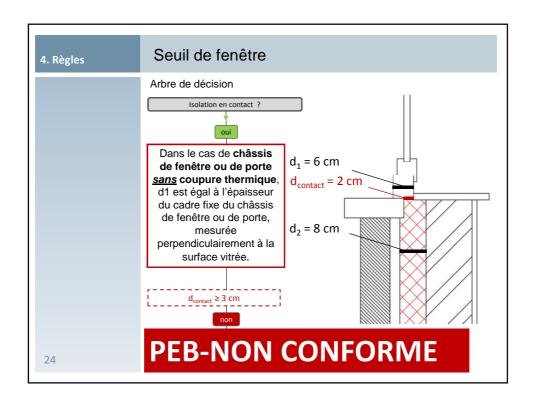

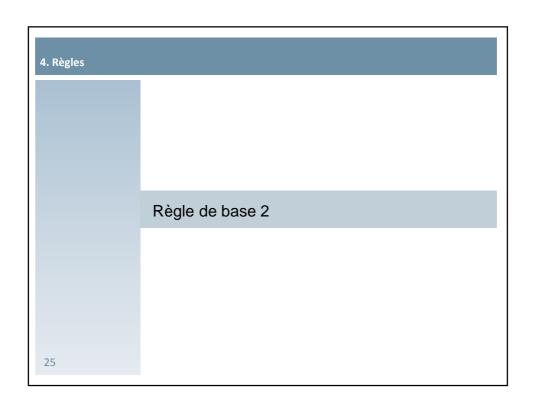

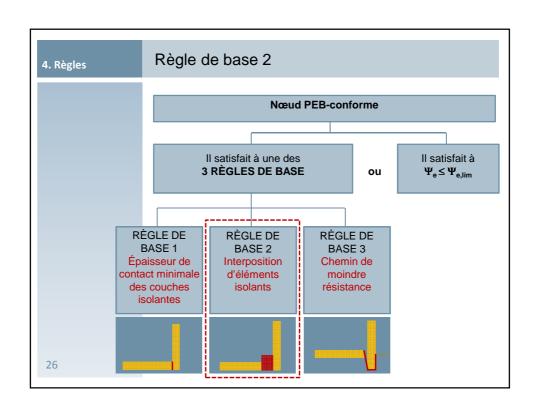

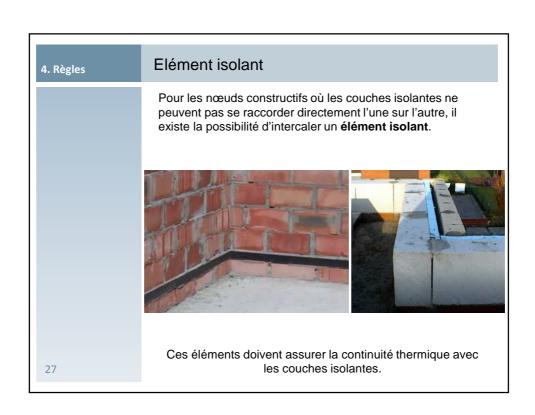

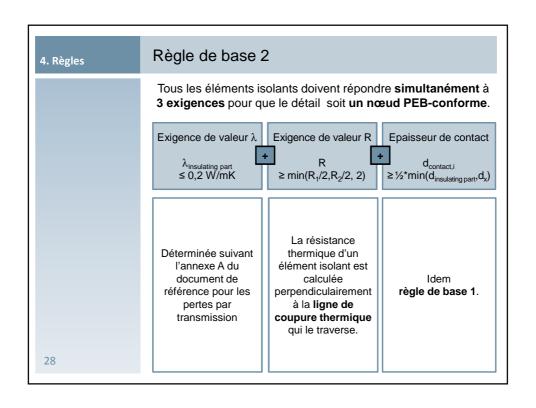

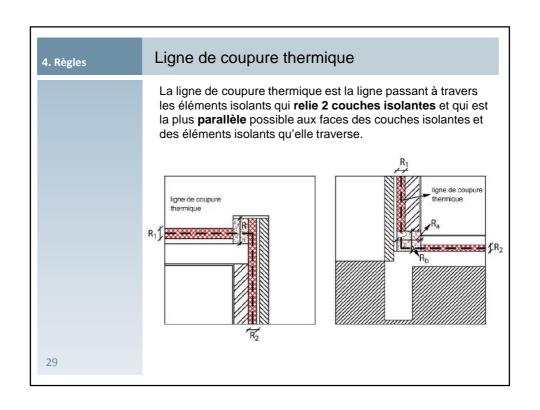

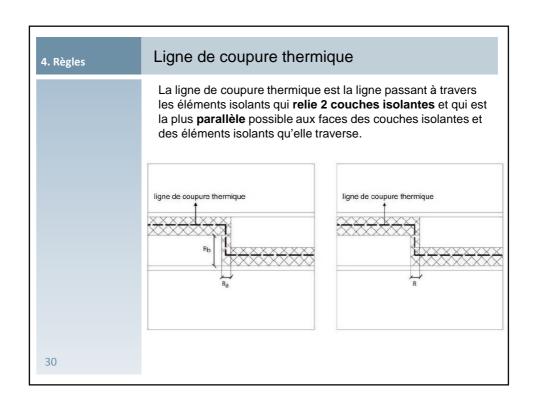

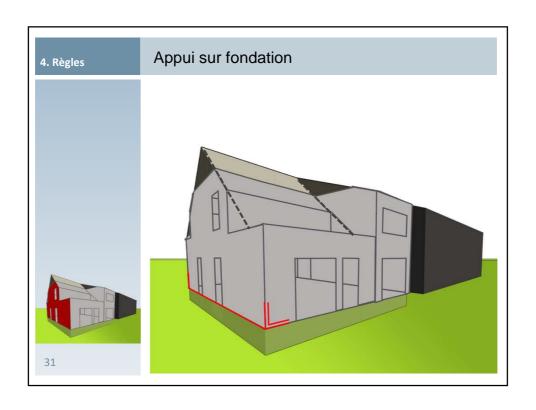

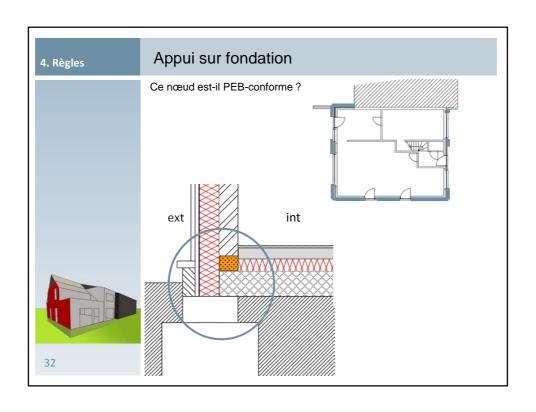

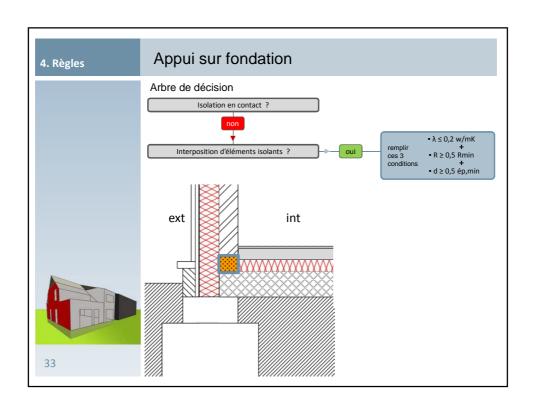

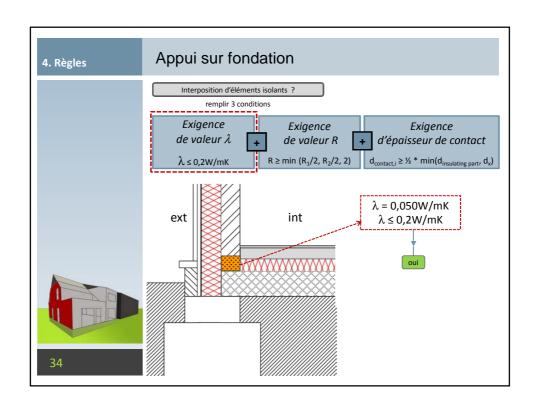

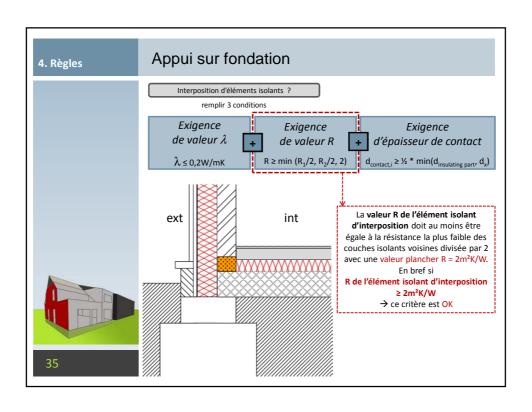

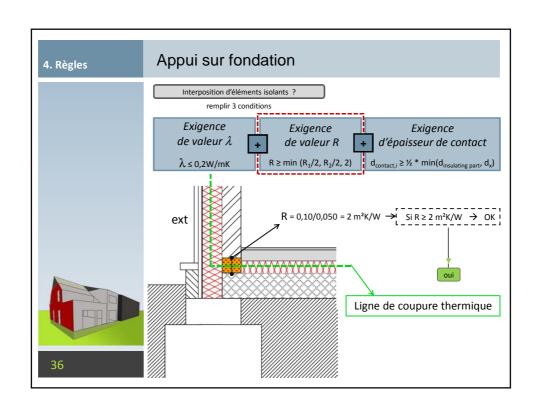

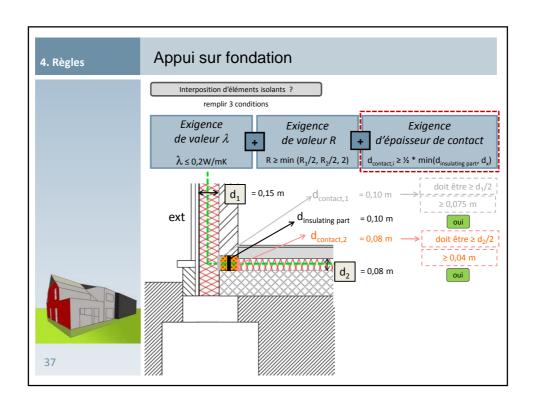

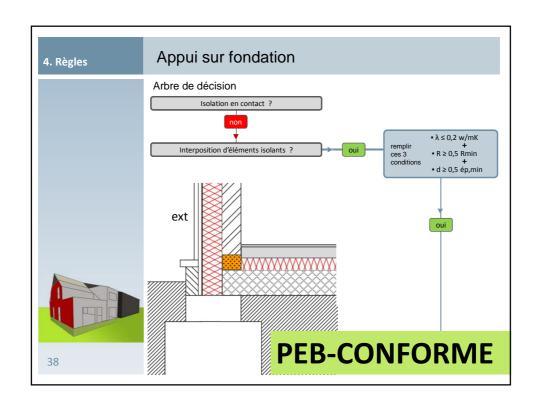

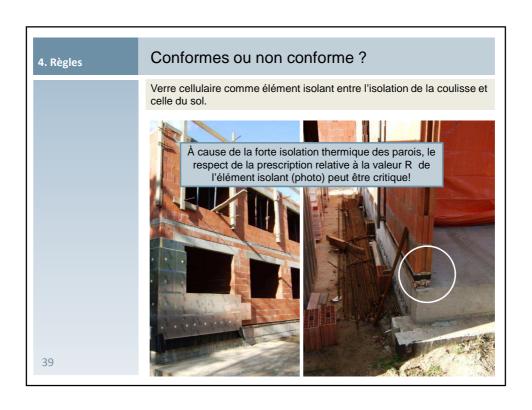

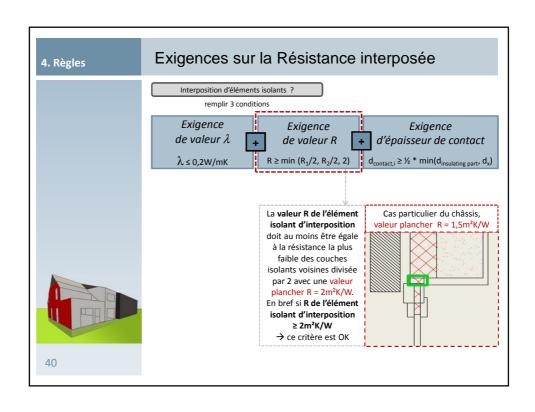

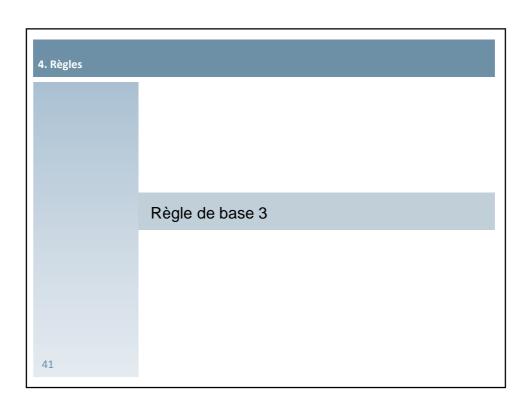

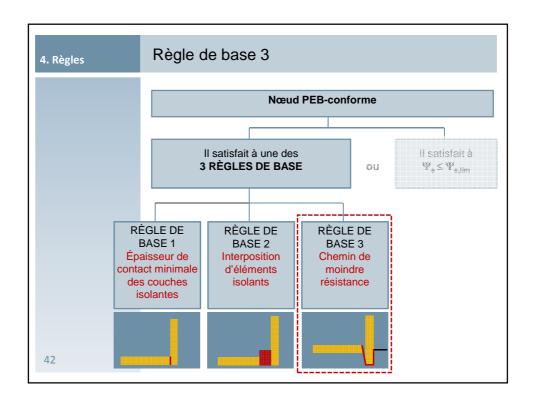

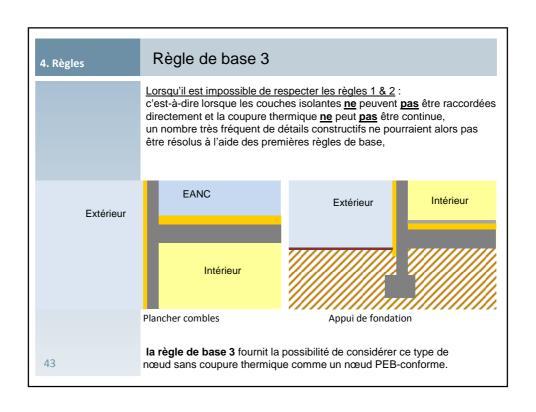

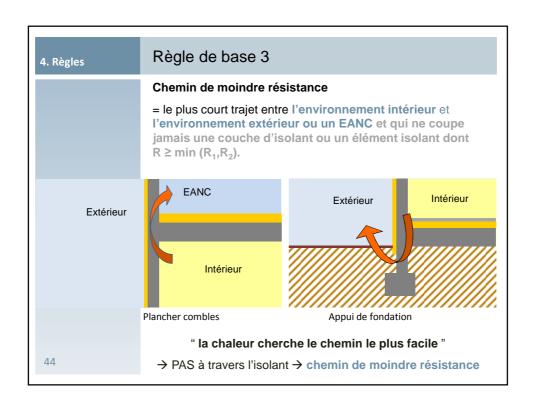

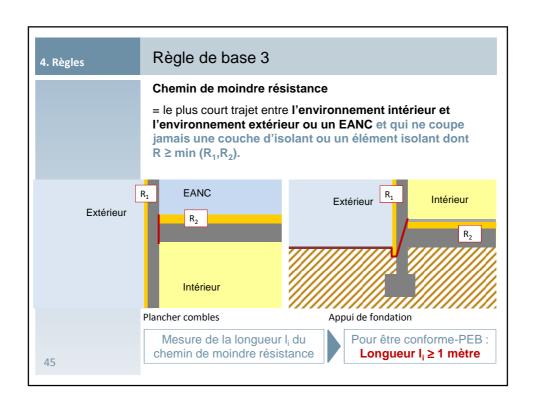

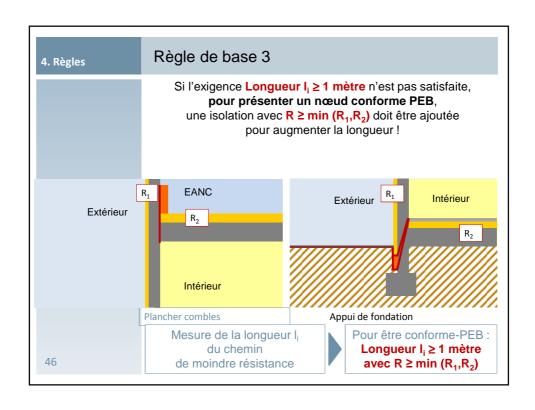

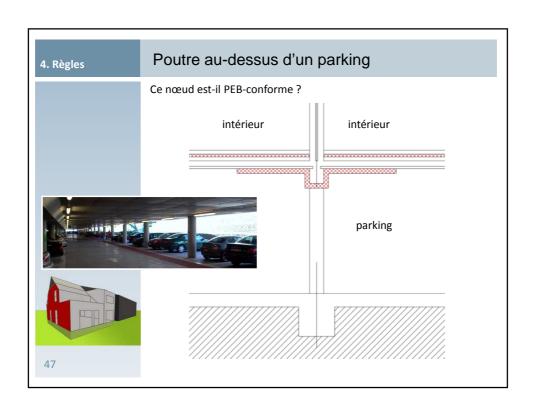

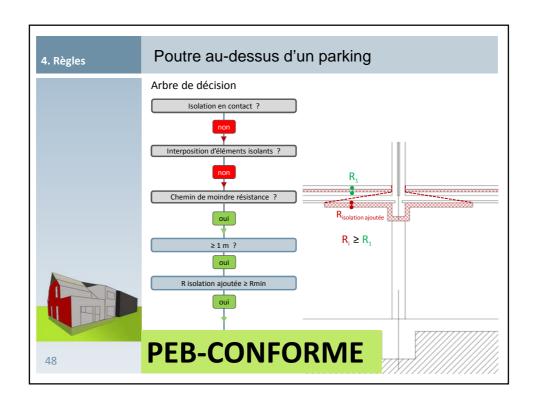

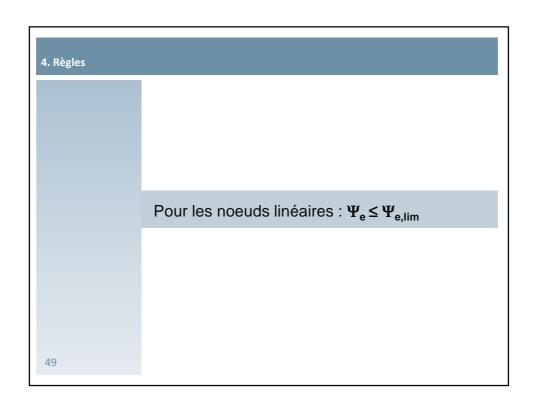

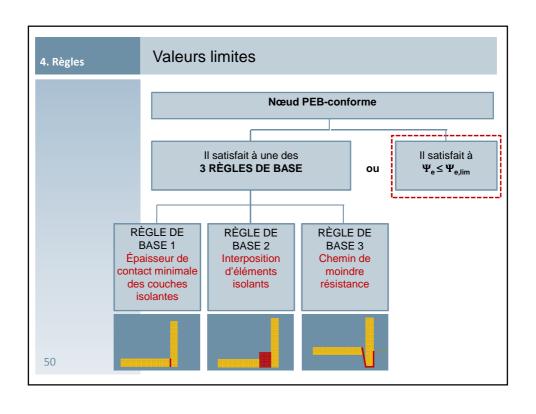

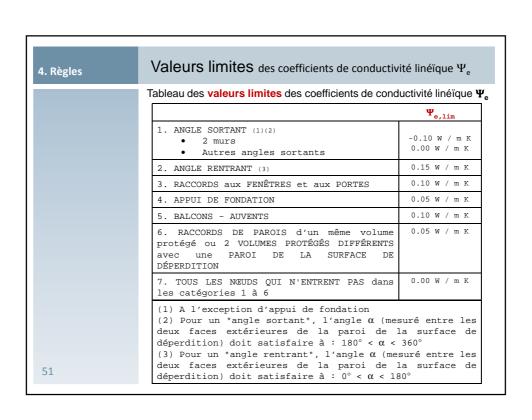

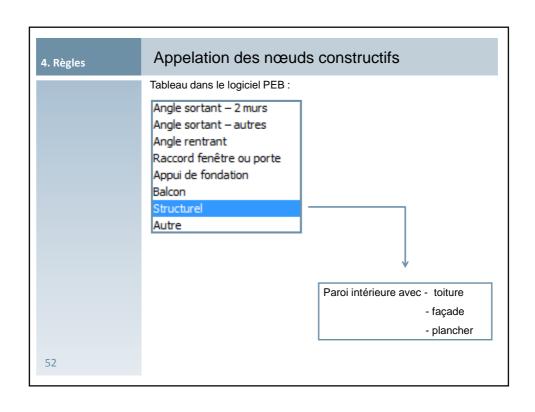

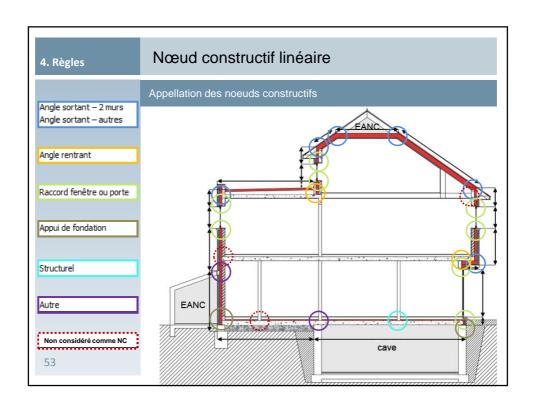

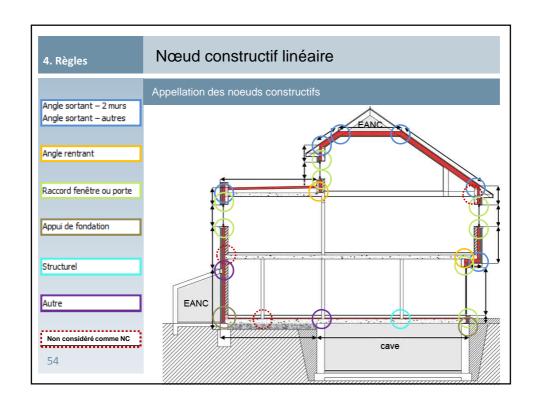

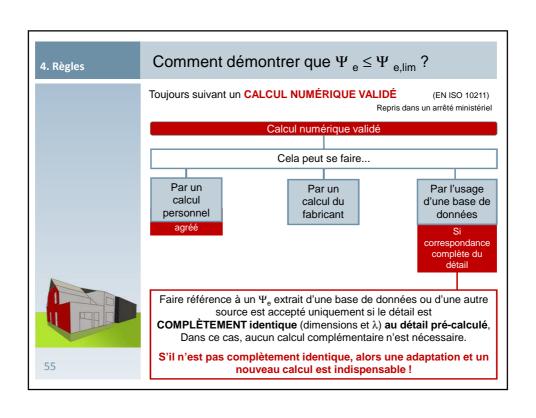

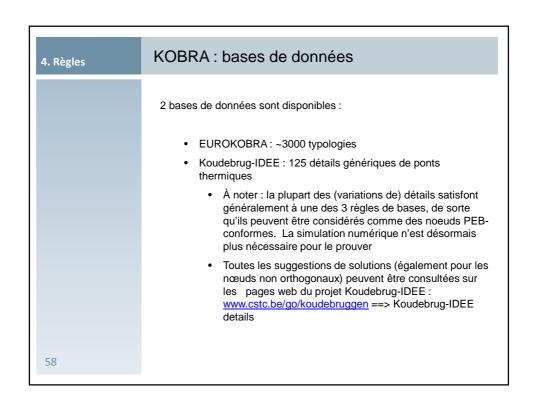

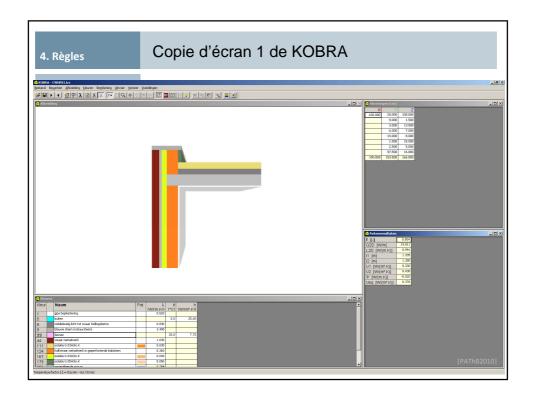

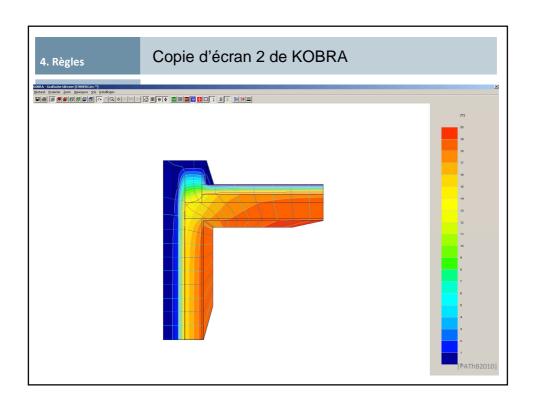

4. Règles	Comment démontrer que $\Psi_{e} \leq \Psi_{e,lim}$?	
Quels programmes de calcul peuvent être utilisés dans le cadre de la PEB ?		
	Tout programme de calcul qui répond aux exigences de l'Annexe A de la norme NBN EN ISO 10211:2008 peut être considéré comme une "high precision method".	
	Exemples de programme de calcul : KOBRA, THERM	
56		

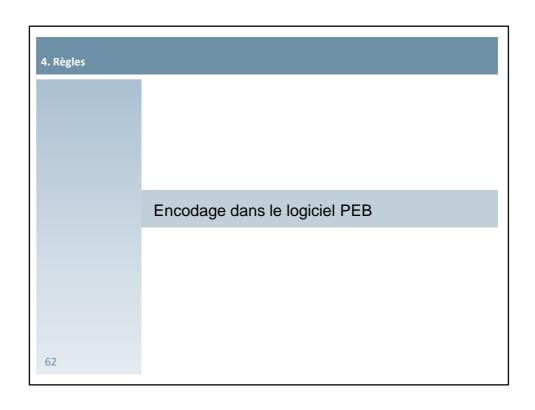

4. Règles	KOBRA
	Gratuit : peut être téléchargé depuis <u>www. cstc.be/go/KOBRA</u>
	Facile à utiliser (période courte d'apprentissage)
	Consulter le mode d'emploi (qui est également installé)
	Limitation : tout nœud orthogonal peut être modélisé, selon des typologies prédéfinies
	 Il n'est pas possible de modéliser le nœud d'une toiture inclinée avec une façade
	 Les épaisseurs de couches, les valeurs lambda et les hypothèses préalables peuvent être adaptées
57	On peut utiliser KOBRA lorsque la typologie de construction du projet se retouve dans la banque de données

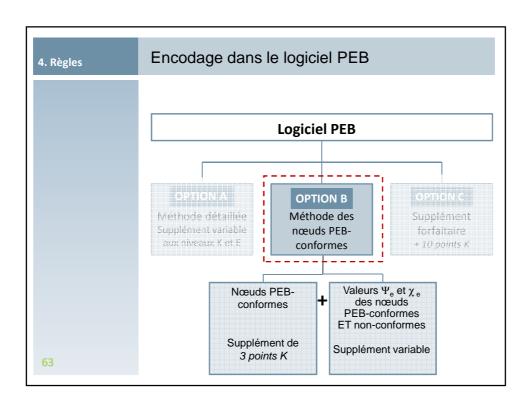

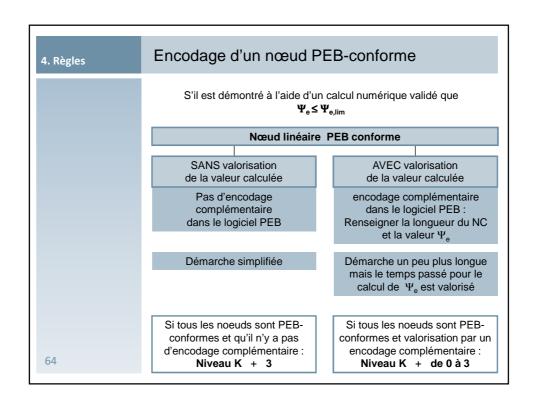

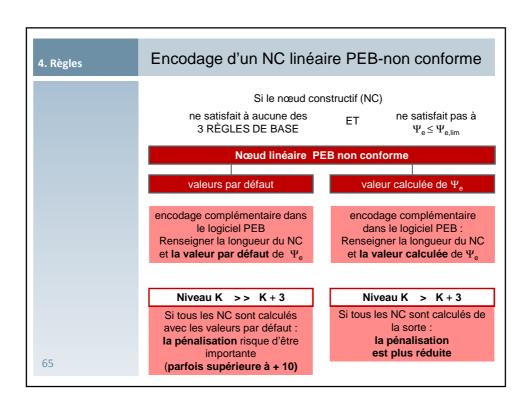

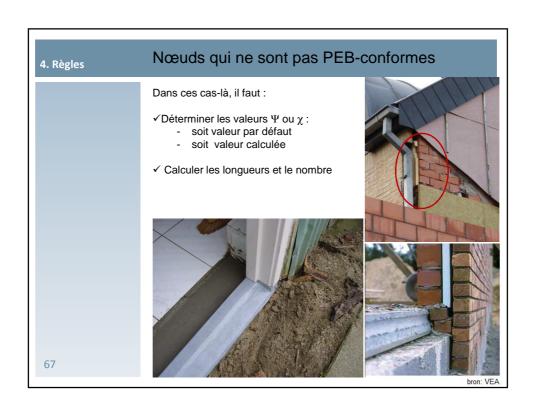

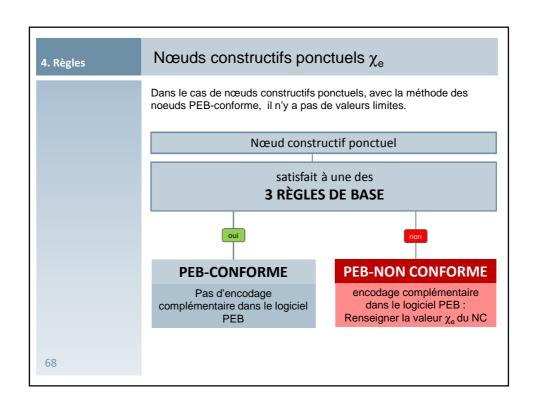

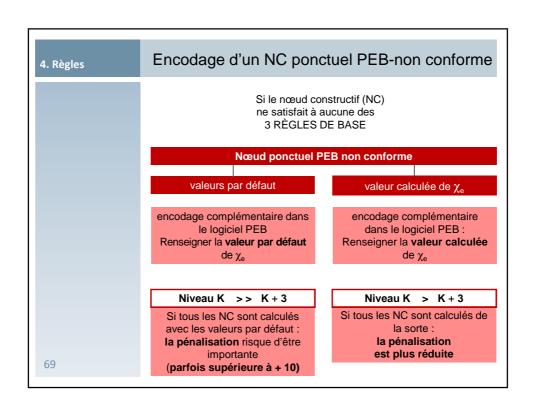

I. Règles	Encodage d'un NC linéaire PEB-non conforme		
	Valeurs par défaut pour les nœuds constructifs linéaires		
	Nœuds constructifs sans coupure thermique avec liaisons structurelles linéaires en acier ou en béton armé. EXEMPLES - Linteaux qui traversent la coupure thermique jusqu'à la face extérieure, - Balcons traversant, - Supports métalliques de la maçonnerie extérieure qui touchent la face intérieure sur toute sa longueur.	0,90 + <i>Y_{e,ilm}</i> W/m.K	
	Nœuds constructifs avec coupure thermique avec liaisons structurelles ponctuelles en métal EXEMPLES - Balcons suspendus avec un système préfabriqué d'ancrage enrobé d'isolant,	0,40 + Y _{e,ilm} W/m.K	
	Autres	$0.15 + \Psi_{e,lim} W/m.K$	

. Règles	Valeurs par défaut des noeuds constr	uctils ponctuels ?
	NŒUDS CONSTRUCTIFS PONCTUELS : 2 ca	tégories
	Valeurs par défaut pour les nœuds constructifs ponct	uels
	Coupures de la couche isolante par des éléments en métal (z = longueur du côté du carré dans lequel s'inscrit le percement, en m) EXEMPLE - Profil I en acier qui traverse la couche isolante d'une façade; - Points de suspension pour supports de maçonnerie;	4,7*z + 0,03 W/K
	Coupures de la couche isolante par d'autres matériaux que le métal (A = surface du percement, en m²) EXEMPLE - Colonne en béton qui traverse la couche isolante d'un plancher;	3,8*A + 0,10 W/K

4. Règles	Valeurs par défaut	
	Percement de la couche isolante par des éléments en métal (z = longueur du côté du carré dans lequel s'inscrit le percement, en m)	4,7 * z + 0,03 W/K
	Exemple : coupe d'un profil I métallique qui perce l'isola 10 cm 4 cm	ant
71	La plus grande dimension = 10 cm $z = 0,1 m$	χ = 4.7 * 0,1 + 0,03 = 0,50 W/K
